SEXUAL VIOLENCE AGAINST PEOPLE WITH DISABILITIES IN THE LAST 10 YEARS: A SYSTEMATIC REVIEW

VIOLÊNCIA SEXUAL CONTRA PESSOAS COM DEFICIÊNCIA NOS ÚLTIMOS 10 ANOS: UMA REVISÃO SISTEMÁTICA

VIOLÊNCIA SEXUAL CONTRA PERSONAS CON DISCAPACIDAD EN LOS ÚLTIMOS 10 AÑOS: UNA REVISIÓN SISTEMÁTICA

Marlon Jose Gavlik MENDES¹
Fátima Elisabeth DENARI²

ABSTRACT: The sexual violence against people with disabilities are part of the various situations of violence reported to the authorities and attended by health, education, and social assistance professionals. This subject is part of the interest of national researchers from different areas of knowledge. The objective of this article was to investigate the Brazilian scientific production of the last 10 years regarding sexual violence against people with disabilities. The method used was the systematic literature review. The database selected was the Capes website. 26 articles were found in the period from 2009 to 2019. Most of these articles had field research on notifications of hospital visits related to violence, with only a few articles analyzing the incidence of sexual violence against people with disabilities. As much as there is significant research in the area, there are still issues related to sexual violence against people with disabilities to be researched.

RESUMO: A violência sexual direcionada a pessoas com deficiência faz parte das diversas situações de violência reportada às autoridades e atendidas por profissionais da saúde, da educação e da assistência social. Este assunto desperta interesse de pesquisadores e pesquisadoras nacionais de diversas áreas do conhecimento. O objetivo deste artigo foi investigar a produção científica brasileira dos últimos dez anos a respeito da violência sexual direcionada a pessoas com deficiência. O método utilizado foi o da revisão sistemática de literatura. A base de dados selecionada foi o portal de periódicos da Capes. Encontrou-se 26 artigos no período de 2009 e 2019. A maioria destes artigos contou com pesquisas de campo em notificações de atendimentos hospitalares oriundos de violência, sendo que poucos artigos analisaram a incidência de violência sexual contra pessoas com deficiência. Por mais quejam significativas pesquisas na área, ainda há temáticas relativas à violência sexual contra pessoas com deficiência a ser pesquisadas.

Introduction

Sexual violence targeting people with disabilities (PcD) is one of the many situations of violence reported to the authorities and dealt with by health, education, and social assistance professionals. The work against sexual violence is diverse, involving the mapping of cases, victim assistance and violence prevention programs and discussion about sexuality and gender in various environments, such as the family and school.

Sexual violence can be understood as:

[...] any sexual act, attempt to obtain a sexual act, unwanted sexual comments or advances, or acts to traffic, or otherwise directed, against a person’s sexuality using coercion, by any person regardless of their relationship to the victim, in any setting, including but not limited to home and work (WHO, 2002, p. 149).

Any sexual act that involves coercion, intimidation, threats, or blackmail, may or may not involve penetration, touching and exposure, and is performed without the consent of the other person is considered an act of sexual violence (WHO, 2002). Sexual violence against children or adolescents is defined in the Brazilian context as:

[...] every sexual act or game with the intention of sexually stimulating the child or adolescent, aiming to use him/her to obtain sexual satisfaction [...].
It can occur in a variety of situations such as: rape, incest, sexual harassment, commercial sexual exploitation, pornography, pedophilia, manipulation of genitalia, breasts and anus, up to the sexual act with penetration, imposition of intimacy, exhibitionism, sexual games and erotic practices not consented and imposed and "voyeurism" (BRASIL, 2010, p. 29-30, our translation).

Within the types of sexual violence, it is common to find incidence of sexual exploitation and rape against children and adolescents. Sexual exploitation, according to the United Nations Population Fund (UNFPA, 2018b), is the forced involvement of children and adolescents in sexual activities of prostitution, trafficking, or forced marriage. Rape is any sexual act, whether or not involving penetration, that is obtained from coercion, constraint, or violence without the full consent of both parties. Both sexual violences are considered crimes punishable in the Brazilian territory according to the Sexual Crimes Law (BRASIL, 2009), besides being classified as categories of violence by the World Health Organization (WHO, 2002).

Specifically, about sexual violence directed to people with disabilities, there is no national research that provides explicit statistics on the number of victims of sexual violence according to the Brazilian Association for Action on the Rights of People with Autism (ABRAÇA, 2016), but there are international surveys that show a high incidence of violence against this public, especially against women and female adolescents with intellectual disabilities. Women with disabilities are ten times more vulnerable and are repeatedly victims of sexual violence. In the case of the male population, men with disabilities are four times more vulnerable than men without such a diagnosis (WHO, 2011; UNFPA, 2018a; 2018b).

Considering the world population, it is estimated that between 40% and 68% of women with disabilities have suffered some situation of sexual violence by the age of 18. In the Brazilian population, it is estimated that up to 90% of women with disabilities experience some style of sexual violence throughout their lives (ABRAÇA, 2016).

Even though there is no nationwide statistical research that quantifies the incidence of sexual violence against people with disabilities, it is noted that there is research on the subject. Because of this, the objective of this article was to investigate the Brazilian scientific production of the last ten years regarding sexual violence against people with disabilities.

---

3 The Statute of the Person with Disability (BRASIL, 2015) defines as person with disability anyone who has physical, mental, intellectual, or sensory impairments that hinder their full participation in society. The types of disabilities are physical, intellectual, hearing, visual, and multiple disabilities. According to the 2010 Census (BRASIL, 2012), more than 45 million Brazilians report having disability.
Method

The research was descriptive, qualitative in nature, and designed based on the method of systematic literature review. For Costa and Zoltowski (2014), the systematic review occurs through specific procedures: initially a research problem is formulated, to then choose the guiding themes to be searched in the literature, which are converted into Boolean operators, finally selecting the databases in which the themes will be searched from the operators. After this initial search, the articles found go through inclusion criteria listed by the researchers, which may be the year of publication, nature of study, public served, among others, to then be selected the articles that will compose the systematic review (SAMPAIO; MANCINI, 2007).

The procedure used for this research can be seen in the following figure:

**Figure 1** – Systematic review procedure

![Diagram showing systematic review procedure](image)

Source: Prepared by the authors

The process of searching, selecting, and including articles can be seen below:

---

4 Sanchez et al. (2019) proposed to rethink the use of the term "Sexual abuse" in scientific research, especially regarding child sexual violence. For the authors, abuse means the excessive use of something or someone, but in the case of children and certain vulnerable populations, there is no distinction between an excessive use and an acceptable use. Any use of their bodies for sexual acts is considered violence. Because of this, the term sexual abuse is not in the body of this article, but it was kept in the search process and in the selection criteria of the articles because it is still present in current research.
Results and Discussion

Analyzing the 26 articles by year of publication, one can see a higher incidence of articles published in the year 2012, with six published articles, and in the years 2017 and 2016, with four in each year:

Source: Prepared by the authors

Regarding the journals in which the articles were published, a higher concentration of articles was found in the Ciência e Saúde Coletiva journal:

5 Search performed on 08/28/2019.

Analyzing the journals used for the publication of the articles it is noted that all are indexed in the area of public health, demonstrating an agreement with the WHO (2002) that sexual violence is an urgent public health problem. It is also remarkable the number of journals indexed in the area of education. This shows that sexual violence is a problem that

---

should not be limited to only one field of study or action but should involve multidisciplinary work and efforts of various professionals in all spheres of society (POLANCZYK et al., 2003; VILAÇA, 2019).

Even though not present in the systematic review, in Brazil there are specific periodicals with themes related to sexual violence and sexuality, such as the Revista Ibero-Americana de Estudos em Educação, linked to the Universidade Estadual Paulista (UNESP) and to the first Brazilian *stricto sensu* post-graduate course in Sexual Education at the same university, and Cadernos Pagu, a journal linked to the Universidade Estadual de Campinas (UNICAMP) and to the Pagu Center for Gender Studies.

Regarding the nature of the research conducted, four theoretical articles were found, seven articles that discussed and analyzed public policies and rights of PcD and 15 field researches. The distribution of the articles can be seen below:

**Figure 4** – Graph of article distribution in relation to the nature of the study

Source: Prepared by the authors

Among the theoretical articles, Tomaz et al. (2016) conducted an integrative literature review of articles and Brazilian legislation published between the years 2002 and 2012 that dealt with the health of people with intellectual disabilities. The authors selected 15 articles and 41 pieces of legislation. Specifically, about sexual violence, the authors found an article from 2009 that corresponds to a study of 53 cases of violence against children and adolescents, being 8.6% of these cases of sexual violence against people with intellectual disability, autism or mental disorder. The authors point out the scarcity of research on sexual violence against people with intellectual disabilities.

The theoretical articles analyzed demonstrated the vulnerability of people with disabilities to situations of sexual violence, in agreement with the discussions of the United Nations Population Fund (UNFPA, 2018a). Vulnerability extends mainly to women with disabilities, with some authors hypothesizing the causes of this phenomenon:

Social isolation, dependence on educators, caregivers and service providers, the type of disability and the degree of functionality associated with disability, the impossibility of physical defense of some people with disabilities and several other impediments to the perception and reaction to abuse lead to situations of greater risk of this social group (MELLO; NUERNBERG, 2012, p. 647, our translation).

On the other hand, the study conducted by Eickmann et al. (2016) shows sexual violence as an antecedent and possible cause of intellectual disabilities and mental disorders. One can notice the double and retroactive relationship that disability and violence maintain between each other; having a disability can lead to a greater vulnerability to situations of sexual violence as an antecedent and possible cause of intellectual disabilities and mental disorders. This relationship can be observed in the following table:

Table 2 – Table of theoretical articles' characterization

Among the theoretical articles, Tomaz et al. (2016) conducted an integrative literature review of articles and Brazilian legislation published between the years 2002 and 2012 that dealt with the health of people with intellectual disabilities. The authors selected 15 articles and 41 pieces of legislation. Specifically, about sexual violence, the authors found an article from 2009 that corresponds to a study of 53 cases of violence against children and adolescents, being 8.6% of these cases of sexual violence against people with intellectual disability, autism or mental disorder. The authors point out the scarcity of research on sexual violence against people with intellectual disabilities.

The theoretical articles analyzed demonstrated the vulnerability of people with disabilities to situations of sexual violence, in agreement with the discussions of the United Nations Population Fund (UNFPA, 2018a). Vulnerability extends mainly to women with disabilities, with some authors hypothesizing the causes of this phenomenon:

Social isolation, dependence on educators, caregivers and service providers, the type of disability and the degree of functionality associated with disability, the impossibility of physical defense of some people with disabilities and several other impediments to the perception and reaction to abuse lead to situations of greater risk of this social group (MELLO; NUERNBERG, 2012, p. 647, our translation).

On the other hand, the study conducted by Eickmann et al. (2016) shows sexual violence as an antecedent and possible cause of intellectual disabilities and mental disorders. One can notice the double and retroactive relationship that disability and violence maintain between each other; having a disability can lead to a greater vulnerability to situations of sexual violence as an antecedent and possible cause of intellectual disabilities and mental disorders.

7 Regarding sexual violence directed to people with disabilities.
violence, just as prolonged situations of violence can harm physical and cognitive development, unfolding into disabilities. Both disability and prolonged exposure to situations of sexual violence are understood here as social determinants of health (SILVA et al., 2019), factors that directly impact the health and well-being of the individual, making him or her more susceptible to illnesses and, as previously discussed, to each other.

Besides the theoretical articles, seven articles were found that discussed public policies and rights concerning people with disabilities. The characterization of these can be seen below:

One of the themes that was widely discussed in the articles was the Unified Social Assistance System (SUAS) and its transformations, proposed by the Organic Law of Social Assistance (BRASIL, 1993). Among the changes in the assistance to people with disabilities, this has gone from being carried out in a specific sector to being considered, among other services, a highly complex demand, requiring a specialized multidisciplinary team and being held in the Specialized Reference Centers for Social Assistance (CREAS) in the municipalities. This change, as Cardoso (2017) points out, was made possible by social pressures from the movements of people with disabilities. According to the author, from the 1990s on, there was an increase in the protagonism of PcD in Brazilian social movements, and one of the main demands was the inclusion of the public in regular education, health, and assistance services. These agendas led to the approach of PcD social movements to other movements and the inclusion in various spaces.

Both SUAS and the Unified Health System (SUS), also present in the articles analyzed, develop practices of care, prevention, and awareness regarding sexual violence seeking decentralization and working in comprehensive care networks (CAMPOS, 2018). Both systems form a complex network of care, while the SUS is the place of first care that victims receive after situations of violence, in the modality of outpatient care (VILLELA; LAGO, 2007), the SUAS is the place for complaints and multi-professional care after medical care. It is also the place where actions are planned to prevent, raise awareness about, and combat sexual violence, which justifies the interest of Brazilian researchers in discussing these systems and the laws that support them.

Besides the theoretical articles and those that discussed public policies, most of the articles found consisted of field research, two of them with research carried out exclusively with people with disabilities, nine also carried out with people with disabilities, and four...
without people with disabilities, but including professionals, parents, and people from the community.

The distribution can be seen in the following chart:

**Figure 5** – Graph of the distribution of the field surveys by participants

demanding more efforts, turning a blind eye to violent situations such as possible cases of sexual violence. There is a protection exercised by family members in relation to their sons and daughters for fear of sexual violence; they are not allowed to go to places alone and talk to strangers. This protection is more intense in girls, with fears of unwanted pregnancy and the search for methods of contraception and sterilization. In the case of boys, the family members interpret sexuality as a need for their children and consider using sex workers for their children to relieve their desires. There is a fear that they will become abusers due to their intellect and their "uncontrolled sexuality".

Cavalcante e Minayo (2009)
Investigating social representations regarding disability rights and violence
Semi-structured Interviews and Operational Groups
Theory of Social Representations
Professionals, managers, and family members from three institutions

In an institution located in a region controlled by illegal drug trafficking and with high rates of violence, there is an incidence of violence against PcD in the family environment and professionals who work there are at constant risk. Because of this, there is a complicity of professionals in relation to the violence that occurs within some families.

Source: Prepared by the authors

On the one hand, there are families that overprotect their children, and on the other, there are professionals who meet families that cause or connive with situations of violence. The overprotection of family members may occur, as stated by Mendes and Denari (2019), due to the myths surrounding the experience of sexuality by people with disabilities. It is common for family members to see their children with disabilities as children devoid of sexuality, infantilizing them, or as people with an exacerbated and uncontrolled sexuality. Both situations were noted in the article by Bastos and Deslantes (2012), the female daughters are seen in an infantilized and overly protected way for being possible victims of sexual violence while the male sons are seen as uncontrolled and may even become violent.

The two articles that brought up field research conducted exclusively with people with disabilities dealt with case studies of women who were victims of sexual violence:

Source: Prepared by the authors

The results of Souto et al. (2012) showed a higher concentration of cases among women aged 12 to 19 years, also between 20 and 28 years. Most of the victims knew the aggressor, being 12 known aggressors, two partners and one father. 12 victims were raped multiple times for a period longer than 20 days and four were verbally and physically threatened by the aggressor and coerced to keep it secret. The results of Simões (2019) point out the little professional training for effective and humanized care of victims of violence, ambiguous legislation, and a long process of pregnancy termination in cases of rape victims.

The results of Souto et al. (2012) are similar to the findings of Moreira et al. (2014) and Cavalcante and Minayo (2009) on professionals who assist PcD, showing the visibility of cases of sexual violence committed within the family nucleus.

The articles analyzed agree with the theoretical articles on the issue of vulnerability of PcD, women with disabilities are one of the most vulnerable audiences to situations of sexual violence. The high incidence of violence against this public, usually by family members and other acquaintances, with multiple episodes and accompanied by threats and intimidation, as well as the difficulty of care after the episode of violence and of pregnancy termination in cases of unwanted pregnancy shows, as discussed by Oliveira (2017) and Campos and Severi (2019), that discussions of health, law and assistance regarding sexual violence against women transcend merely epidemiological studies and encompass sociological, economic and epistemological discussions. Current social relations and the economic gap between genders make women, with and without disabilities, more susceptible to violence of all kinds, including sexual violence:

[...] As sexual rights were formulated from their negativity, the exercise of these rights indicates that abortion can only be performed when the juridical good of sexual dignity, and not the person herself, is violated. Thus, in both

---

10 Not specified in the article.
cases one makes use of a moral economy [...] in which pain, suffering, and sadness become a language through which the right to terminate a pregnancy becomes a possibility (SIMÕES, 2019, p. 126-127, our translation)

Most of the field researches found were also carried out with people with disabilities; the characterization of the nine articles can be seen below:

11 Not specified in the article.
rejection in their families, causing little autonomy in their lives and a scarce social and support network. Adding this to the social constructions regarding disability and the role of women in society, the difficulties of access and care for these women and the myths regarding their sexuality, it was observed that these women are more vulnerable to violence, including sexual violence.

Mascarenhas et al. (2012) Describe the notifications of violence against the elderly
Descriptive study/Statistical analysis
3593 notifications by the Surveillance System of Accidents and Violence (VIVA)

Assis et al. (2012) Describe the cases of violence against children
12473 notifications by the System of Surveillance of Accidents and Violence (VIVA)

Source: Prepared by the authors

Most of the articles analyzed, seven in total, conducted statistical analysis of the notifications of violence from the System for Surveillance of Accidents and Violence (VIVA). VIVA, according to Assis et al. (2012), was an important milestone for violence control and prevention policies, as it enabled the visualization of the incidence of violence in the national territory, serving as a basis for coping strategies and descriptive studies, as can be seen in the articles analyzed. About the VIVA system:

The Violence and Accidents Surveillance System (VIVA), implemented in 2006 by the Ministry of Health, aims to enable the collection of data and dissemination of information on violence and accidents. VIVA was structured in two components: the first related to continuous surveillance of domestic, sexual, and other interpersonal and self-inflicted violence (Continuous VIVA); the other component is the sentinel surveillance of violence and accidents in hospital emergencies (Sentinel VIVA). As of 2009, the continuous surveillance component of VIVA was incorporated into the Sistema de Informação de Agravos Notificados (Sinan-Net), adapting to its specific rules regarding the standardization of data collection and submission (ASSIS et al., 2012, p. 2306, our translation).
Research has shown that women, both children and adolescents, and the elderly are more vulnerable to sexual violence. Regarding people with disabilities, the research showed the incidence of violence directed to them, but none of the articles discussed the direct correlation between having some disability and being a victim of violence, nor compared the percentages of victims of sexual violence between PcD and people without disabilities, being issues that can be addressed in future studies.

Platt et al. (2018) hypothesize the greater vulnerability of PcD to situations of sexual violence and the complexity of care in these cases, given the difficulty of identifying the symptoms of children who experience situations of violence together with the limitations of disability itself. The issue of sexual violence emerged in the research of Neves-Silva et al. (2015) as a fear of family members regarding the coexistence of their children with disabilities in the community and in the world of work, as can be seen in the speech of a family member: "I am afraid, yes. Fear of accidents, cutting a finger, cutting a hand, sexual abuse, involvement with drugs, all this makes us afraid, very afraid" (Silva et al., 2015, p. 2553).

On sexual violence directed at children and adolescents with disabilities, Assis et al. (2012, p. 2315, our translation) state that:

The greater awareness of professionals in the attention to cases of sexual violence; the severity of these cases, which require seeking care by the health service; and the trivialization of physical violence against children are some of the justifications for the higher number of notifications of sexual abuse by health professionals, compared to other forms of violence.

The theme of vulnerability of people with disabilities, especially women, to situations of sexual violence emerges as one of the most present issues in the articles. A theme also discussed in the article by Ottoni and Maia (2019) on sexuality and the Autistic Spectrum Disorder (ASD). Both the theoretical articles and the field research of the review carried out point to the greater fragility of this public, and when they are victims of violence, as shown by Souto et al. (2012), the episode usually occurs repeatedly, the aggressor is someone from the family or close to them and threatens/intimidates the victim to keep it a secret. All the field researches that carried out statistical analysis on the notifications of violence in the 'VIVA' system verified the presence of cases against PcD, mostly women, but no research compared the prevalence of violence in the population with disabilities in relation to the population without the diagnosis of disability, ascertaining whether women with disabilities are actually more victims than women without such a diagnosis.
Final considerations

Discussing sexual violence directed at people with disabilities is complex, involving theoretical notions of psychology, sociology, and law, encompassing the fields of education, health, and social assistance. This theme arouses the interest of Brazilian researchers.

Analyzing the Brazilian articles published in the last ten years that deal with the subject, it was noted a higher incidence of field research that performed statistical analysis on notifications of violence directed to the general public, including also people with disabilities. In contrast, there are few studies that have investigated exclusively PcD and their relationship with the phenomenon of violence, while no research has compared the incidence of violence in PcD in relation to people without disabilities.

While the field researches brought statistical data on the incidence of violence, with some characterizations about the victims and aggressors, the researches that investigated the public policies brought information about the assistance to victims of violence, both in health and social assistance. Finally, the theoretical articles circumscribed these themes by dealing with the conceptions of disability and the vulnerability associated with this condition, discussing the retroactive relationship between disability and vulnerability to violence. However, as much as the vulnerability of PcD is pointed out in the theoretical articles, this vulnerability was not empirically investigated in the field research.

There is still more research to be done and areas of knowledge to be explored, the Brazilian scientific field demands statistical analysis of the notifications of violence exclusively of people with disabilities, with comparison of these findings to the notifications of the typical population, in addition to case studies of PcD victims of sexual violence and field research that empirically debate on the vulnerability that this public has in relation to violence, relating the data with the theoretical discussions of the area of education, gender studies and feminist movements. Intervention and violence prevention programs are also needed. It is hoped that this article has contributed to the understanding of the current Brazilian scientific field and enabled new areas of research and studies that have not yet been contemplated.
